Offer Engine: Status Report

Personalised Offer Engine · Hackathon 2 (Punjab Jobs AI Bootcamp, J-PAL SA) · Thu 22 Oct 2026 · Version v0.1 (Foundation) · Repo: github.com/Navkaur-codes/Offer-Engine · Deadline: **Tue 27 Oct, 12:00 noon**

6	19	13	21	6 / 8	~4.5
commits pushed to main	automated tests passing	database tables defined	cross-session ports (stubbed)	Step-0 setup steps done	days left to the deadline

1. What is done

Planning and control documents

- Brief analysed. Plan v2 agreed: an **analytics + agentic decisioning platform**, not a store.
- Core idea: "Don't pay people who'd buy anyway" (uplift scores, 10% holdout, margin saved).
- Layered rules: Global → Festival → Persona → Individual. Lower layers can only tighten.
- Festival-aware offers (Karwa Chauth, Dhanteras, Diwali, Gurpurab, Lohri) with cultural guardrails.
- Customer Lab with 10 persona bots in one Telegram group, run by the backend.
- 11 docs: CLAUDE.md, PLAN, contracts, detective (28 traps), prompts, progress, sessions, 4 context files.
- Git rule: you commit and push; sessions stop with a commit checkpoint and wait.

Foundation code (on main, all pushed)

- **contracts.py**: every shared data model (Decision, Profile, Rule, Festival...), strictly checked.
- **config.py**: settings from env; IST clock with demo **time-travel** (demo Dhanteras any day).
- **db.py + models.py**: SQLite locally, Neon Postgres in production; 13 tables.
- **ports.py + stubs.py**: sessions call each other through ports; realistic stub data until merged.
- **main.py**: /health + Telegram webhook secured by URL secret and header.
- **Hello bot**: /start works; polling mode tested locally with your real token.
- **Deploy files**: Dockerfile + render.yaml (Render free plan, Singapore).
- **Fixed**: blank .env values crashed startup; bot token was leaking into logs.

Commit	What it added
`a73db39`	initial commit: plan and control documents
`ee4c27a`	backend scaffold and shared contracts v1
`98fa675`	settings, IST clock with demo override, db engine and tables
`263d388`	ports with lazy real/stub routing and contract-valid fixtures
`b8d28ce`	FastAPI entrypoint, secured Telegram webhook, hello bot, Render blueprint
`3cb8857`	fix: blank env values as unset; keep bot token out of logs

2. What comes next

Today (finish v0.1): Step 7, deploy: Neon DB, Render service, webhook secret, cron-job.org ping every 10 min, and share the bot link with classmates. **Step 8:** create the 4 branches, freeze contracts v1, update the docs, then start 4 parallel sessions.

When	A: Data & Scoring	B: Decision Core	C: Telegram + Lab	D: Dashboard
Fri 23 · v0.2	Personas, 12-month day-by-day generator, festival calendar, seed	Rules engine (4 layers) + one evaluate() + property tests	Onboarding /start, offer card, /profile, /stop	Ledger theme, app shell, Ctrl+K palette, kill switch
Sat 24 · v0.3	RFM, churn model, live policy assignment	Agent harness + rules fallback (mock LLM)	/simulate commands, buttons, /why	Overview + Decisions log with explanations
Sun 25 · v0.4	Uplift model, impact, realism and experiment stats	Real Groq agent + message validator	Customer Lab: 10 bots, live group loop	Rules editor with impact preview, Customers
Mon 26 · v1.0	Tune to benchmarks, data dictionary	Daily AI digest, batch dry-run	Admin commands, polish, resilience	Experiments, Festivals, Realism, Playground

Gates (main session): after each phase you merge the branches; then tests, smoke test, deploy, and claude-progressive.md is rewritten. **Mon 18:00 feature freeze** → classmate test round, README, screenshots. **Tue by 10:00 submit** repo + bot username.

3. Your to-dos and watch-outs

- Finish the deploy (Render URL → I verify /health).
- Share the bot link today: Telegram only reaches people who pressed Start.
- By Sun: create 10 customer bots, the "Customer Lab" group, and a shadow channel.
- Run each commit checkpoint, then reply "committed".
- Groq free tier limits → the rules fallback always sends.
- Render free tier sleeps → cron-job.org ping keeps it awake.
- Festival dates for 2026 must be verified (Session A).
- Never paste tokens or keys in chat; .env and Render settings only.
